A new Bayesian toolkit for the estimation of occupational exposure levels compared to exposure limits

Jérôme Lavoué, Lawrence Joseph, François Lemay

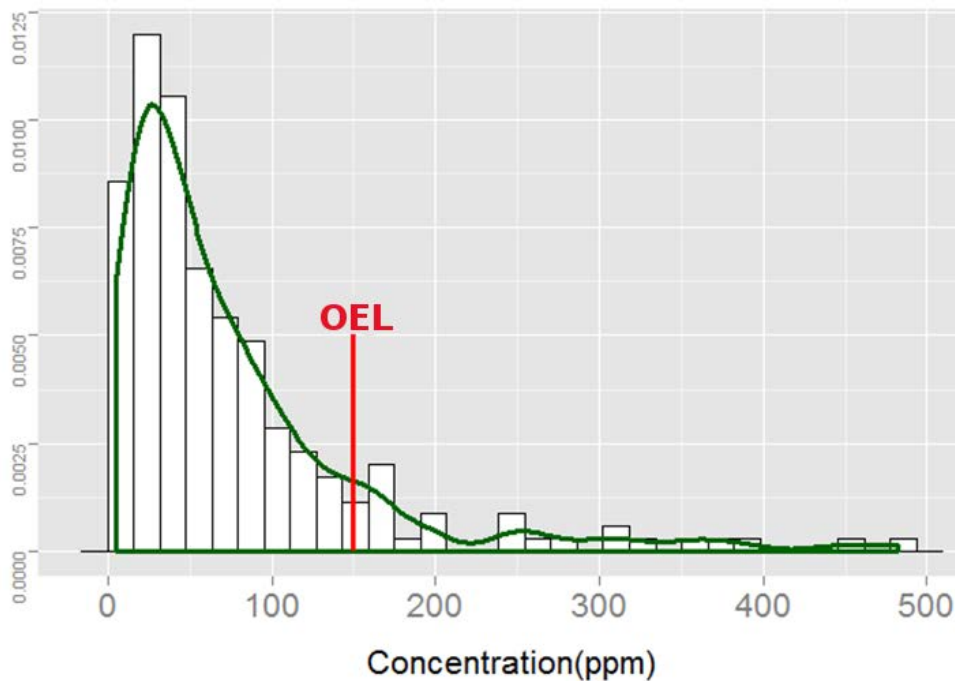

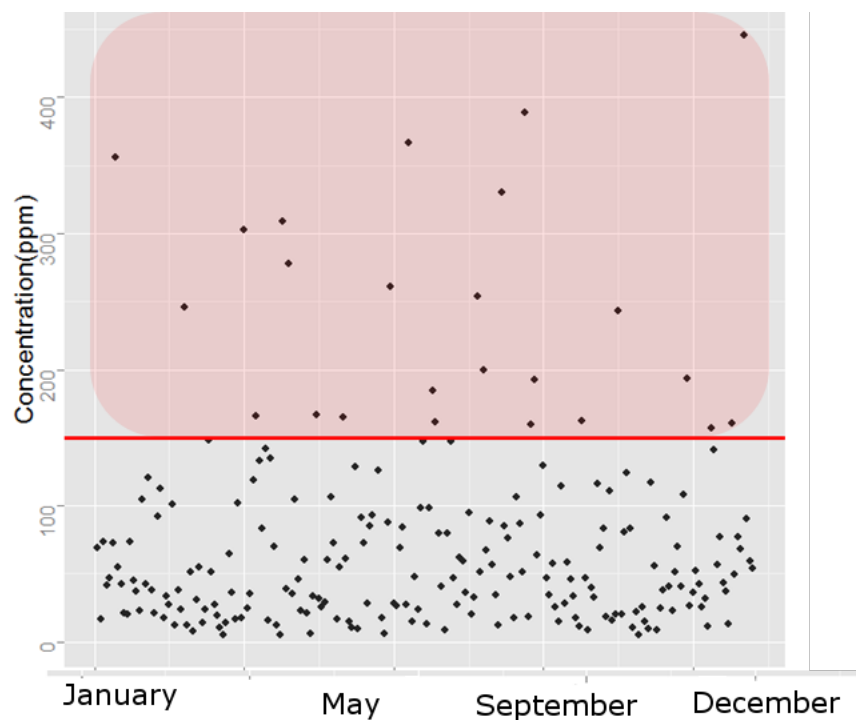

The origin of the problem

Exposure varies across time and space, and is usually measured very seldom

We have a statistical framework

- ❖ We assume exposure levels follow a lognormal distribution
- ❖ We estimate the proportion of days expected to result in overexposure
- ❖ This proportion (exceedance) should not be $>5\%$
- ❖ The final decision should take into account statistical uncertainty

We have a statistical framework BUT.....

Lognormal stuff :

- ❖ Not taught in basic sciences
- ❖ Not often taught in biostats 101
- ❖ Very few user friendly tools

Bayesian statistics for industrial hygiene

Rating Exposure Control Using Bayesian Decision Analysis

Bayesian models in www.expostats.ca

Principle

Prior uncertainty distribution
about a parameter P
What we know before data

Likelihood function for P
what the data has to say

Posterior uncertainty
distribution about P
What we know after data

Prior distributions in expostats

Geometric mean

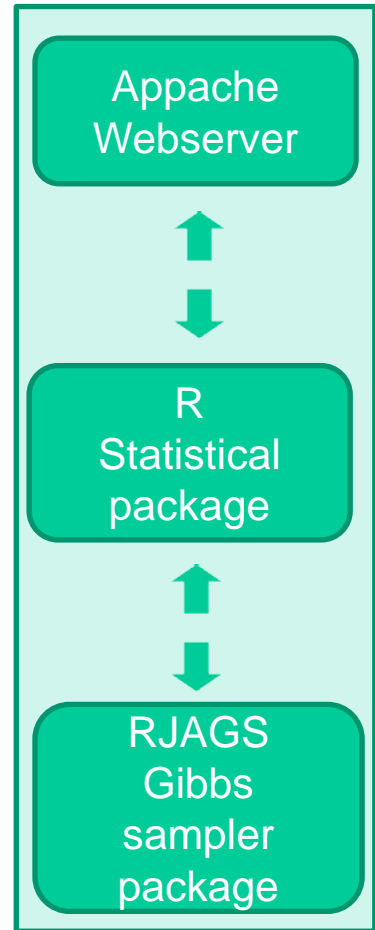

- Centered on 5% of exceedance given a gsd of 2.3
- Uniform on $\log(\text{gm})$
- 80% of prior in $[10^{-36}-10^{+34}] \cdot \text{OEL}$

Geometric standard deviation

- Based on Kromhout/Rappaport/Symanski (1993)
- Lognormal on $\log(\text{gsd})$
- 80% of prior in [1.5-6.5]

How expostats works

LINUX SERVER

Features

- ~ 30 simultaneous users
- English-French
- Censored data with multiple censoring points
- Tools
 - One lognormal distribution
 - One lognormal distribution (between-within worker variance)
 - 2 lognormal distributions (before/after)
- Statistics : descriptive / Q-Q plot / 95th percentile / Exceedance

How expostats look

Quite basic at the moment....

Statistical tools for the interpretation of industrial hygiene measurement data

Introduction

This Web site is a portal for a group of statistical tools aiming at supporting industrial hygiene practitioners for the

EXPOSTATS

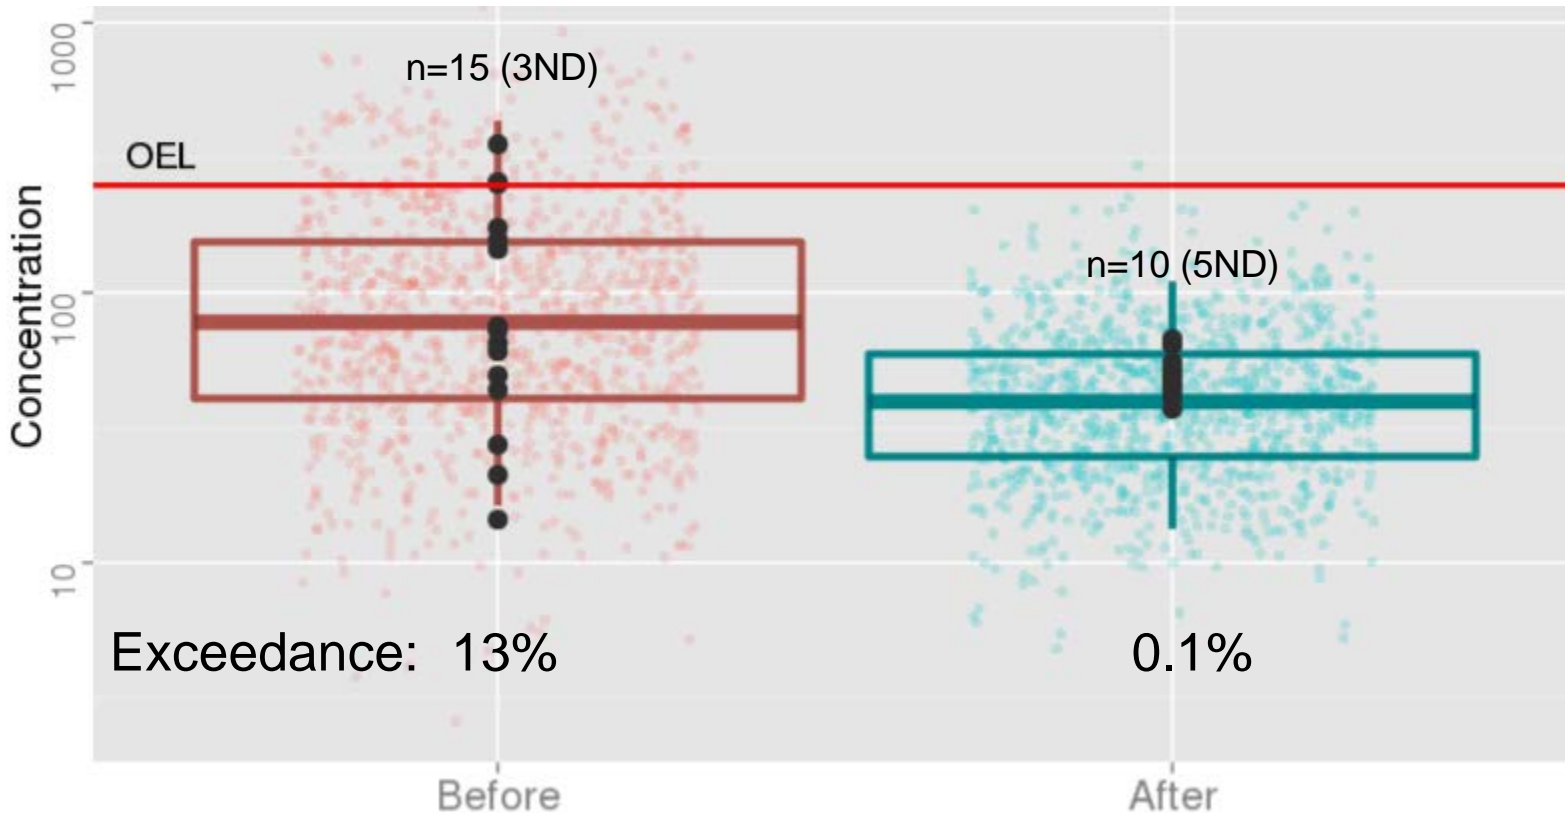

OUTILS STATISTIQUES POUR L'INTERPRÉTATION DES DONNÉES D'HYGIÈNE

[HOME](#) [INTERPRETATION TOOLS](#)

But a new version is coming up !

Example : Effect of an intervention

Reduction % in the geometric mean : 52% [8.6 ; 77]

Reduction in the geometric standard deviation (in gsd unit) : 0.94 [-0.68 ; 2.8]

Reduction in the exceedance fraction (in exceedance %) : 12% [3 ; 27]

Chance that the expected decrease was achieved (%) : 83%

Simulations – complete samples

GM=0.3*OEL
GSD=2.5
4 000 iterations

Method

- Expostats
- IHSTAT
- Bayesian uninformative

RMSE

Tolerance limit coverage

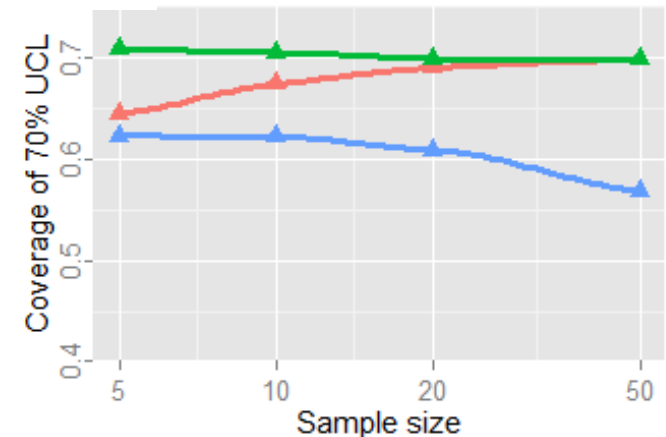

Simulations – censored samples

30 000 iterations
GSD=3

Method

- Expostats
- Krishnamoorthy
- LOQ/2

30%
censored

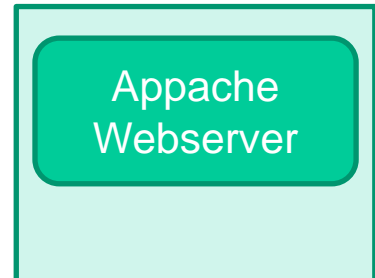

50%
censored

Future developments: WEBEXPO

LINUX SERVER

This part is painful

Webexpo project (2015-2018)

Objective : Create a library of code in Javascript and Csharp/Java that implements IH calculations using Bayesian routines
